Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Maximum Marks: 2 Marks

Problem Statement (PS)

PS-1

I am (Customer):
A ServiceNow user who needs to access institution records based on my assigned role and branch.

I'm trying to:
View the records that I am authorized to access, particularly records belonging to the EEE branch.

But:
I may be able to access records that should be restricted to other users or may be denied access to records that I am authorized to view if proper access controls are not configured.

Because:
The system needs to evaluate both the user's role and the Branch field value before allowing access to a record.

Which makes me feel:
Concerned about unauthorized access to records and the security of the information.

PS-2

I am (Customer):
An administrator responsible for maintaining secure access to institution records in ServiceNow.

I'm trying to:
Control which users can view, create, modify and delete records according to their assigned roles.

But:
Users without the required permissions must not be allowed to access or modify restricted records.

Because:
Different users have different access requirements, and the system must enforce record-level security using ACLs.

Which makes me feel:
Concerned about data security and the possibility of unauthorized access, modification or deletion of records.
