Project Design Phase-II — Solution Requirements

Date: 03 October 2026
Team ID: 6aba117e538da4003d63184c
Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks: 4 Marks

Functional Requirements

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	**User & Role Management**	Create users in ServiceNow; assign appropriate roles; manage user access permissions
FR-2	**Table & Record Management**	Create and configure the u_institution_details table; add required fields such as Branch; create sample records
FR-3	**Access Control Configuration**	Configure READ, CREATE, WRITE and DELETE ACLs; assign ACLs to appropriate roles; control access to table and records
FR-4	**Script-Based Access Restriction**	Validate the Branch field using ACL scripts; restrict unauthorized users from accessing specified records; allow authorized users to perform permitted operations

Non-Functional Requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	The ACL configuration should be simple to understand and easy for administrators to manage and maintain.
NFR-2	**Security**	The system should prevent unauthorized users from viewing, creating, modifying or deleting restricted records.
NFR-3	**Reliability**	ACL rules and scripts should consistently enforce the defined access policies without unexpected permission changes.
NFR-4	**Performance**	ACL checks and scripts should execute efficiently without causing noticeable delays while accessing records.

NFR No.	Non-Functional Requirement	Description
NFR-5	Availability	The access-control mechanism should remain available whenever users access the ServiceNow table and its records.
NFR-6	Scalability	The ACL solution should support additional users, roles, branches and access rules as the number of records and users increases.
