Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks: 2 Marks

Problem–Solution Fit

Section	Description
Target Users / Customers	ServiceNow administrators and users who access and manage institution-related records.
Customer Problem	Users with general access may be able to view, create, modify or delete records that they are not authorized to access. Basic role-based permissions alone may not provide sufficient record-level control based on specific field values such as Branch.
Existing Situation	Access to records is controlled using ServiceNow users, roles and ACLs. However, additional field-based restrictions may be required to prevent unauthorized access to specific branch records.
Customer Need	Administrators need a simple and reliable mechanism to control access to institution records based on user roles and specific record attributes such as Branch.
Proposed Solution	Implement ServiceNow ACLs for **READ, CREATE, WRITE and DELETE** operations and use server-side ACL scripts to validate the Branch field before granting access.
How the Solution Solves the Problem	When a user attempts to access or modify a record, ServiceNow evaluates the user's role and the applicable ACL. The ACL script then checks the Branch value and allows or denies the requested operation according to the configured access rule.
Key Benefit	Prevents unauthorized viewing, creation, modification and deletion of restricted institution records.
Value to Administrator	Provides centralized access control that can be configured and modified without changing the entire application.
Expected Outcome	Only users with the required authorization can perform permitted operations on the relevant institution records, while unauthorized requests are denied.
Problem–Solution Fit	The solution directly addresses the identified access-control problem by combining **role-based authorization with field-level/record-based ACL scripting**.

Problem → Solution → Outcome
