Project Design Phase

Proposed Solution

Date: 03 October 2026
Team ID: 6aba117e538da4003d63184c
Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks: 2 Marks

S.No.	Parameter	Description
1	**Problem Statement (Problem to be solved)**	In ServiceNow, users may have access to institution records based on their assigned roles, but role-based permissions alone may not be sufficient when access needs to be restricted according to specific record attributes such as **Branch**. Unauthorized users may therefore view, create, modify or delete records that they should not be permitted to access.
2	**Idea / Solution description**	The proposed solution uses **ServiceNow Access Control Lists (ACLs)** to control **READ, CREATE, WRITE and DELETE** operations on the u_institution_details table. User roles are combined with **server-side ACL scripts** to validate the Branch field and determine whether the requested operation should be allowed or denied.
3	**Novelty / Uniqueness**	The solution combines conventional role-based ACL authorization with **script-controlled, field-based access validation**. Instead of relying only on user roles, the ACL script dynamically evaluates record information such as Branch before granting access. This provides more granular and flexible access control.
4	**Social Impact / Customer Satisfaction**	The solution protects institution-related information from unauthorized access and modification. It improves data privacy, reduces the possibility of accidental or unauthorized changes, and gives administrators better control over sensitive records. This can increase user confidence and administrator satisfaction.
5	**Business Model (Revenue Model)**	The solution is primarily an **enterprise access-control implementation** rather than a standalone revenue-generating product. It can be offered as a ServiceNow configuration/customization service to organizations that require customized record-level access control. Revenue can be generated through implementation, customization, maintenance and support services.
6	**Scalability of the Solution**	The solution can be extended to additional users, roles, branches, tables and access rules. New ACL conditions and scripts can be configured as requirements grow without

		redesigning the entire system. The ServiceNow platform provides the underlying infrastructure for supporting larger numbers of users and records.
